Foreword

This report provides a broad income picture of a cross section of the population aged 55 or older, with special emphasis on income of the population aged 65 or older. The tabulations focus on the major sources and amounts of income, both separately and combined, for these age groups. The relative importance of particular sources to total income is measured for individual units and the share of aggregate income from particular sources is measured for the aged as a whole. Proportions of the aged below the poverty line are presented in terms of their own incomes and the incomes of the families with whom they live. Several tables describe the economic situation of the aged with varying levels of Social Security benefits and total money income. These data are a valuable resource for policymakers and researchers in government and in the private sector.

The report was compiled within the Program Analysis Staff, Office of Research and Statistics, by Susan Grad. Jeffrey Shapiro provided programming assistance to photocompose the tables. Additional information may be obtained by calling Susan Grad: 202-282-7094.

Preface

Since 1941, the Social Security Administration (SSA) has periodically surveyed the economic situation of the aged as part of its legislative directive to study the most effective methods of providing economic security. Between 1963 and 1972, three surveys were made that were national in scope and sampled nonbeneficiaries as well as beneficiaries. In 1963 and 1968, SSA administered its own questionnaire and combined data from these surveys with Social Security record data of the survey respondents. In 1972, SSA benefit record data were combined with Bureau of the Census data from the March Current Population Survey (CPS).

SSA then began a series of biennial studies of the income of the aged based on CPS data alone. The first report in the series described the income of the population aged 55 or older, and in some cases of the population aged 65 or older, based on 1976 data. The second report described apparent changes in the income of those age groups between 1976 and 1978. In the interest of publishing the data in a more timely fashion, however, beginning with the 1980 report, publications in the series have consisted of tabulations only.

The source of data for this series is the March supplement of the CPS, which samples a large cross section of households in the United States each year and provides detailed information annually on income and labor-force participation. Comparisons of CPS estimates with more precise estimates adjusted by Federal income tax records and Social Security records, made by Daniel Radner of the Social Security Administration, indicate that

some sources are underreported in the CPS. Also, changes that have been made in the survey from time to time have improved the measurement of income and labor-force participation but have reduced the comparability of estimates between years. Despite the shortcomings of the CPS data, they are used here because they provide the best available measures of income for detailed subgroups of the aged.

The Bureau of the Census also conducts a survey called the Survey of Income and Program Participation (SIPP) to expand upon and improve the measurement of economic status. In future years, SIPP data may be incorporated into this series.

The data in this publication are presented in terms of either aged units or aged persons. An aged unit is a married couple living together or a nonmarried person. Using aged units or aged persons as the units of analysis allows one to measure incomes of the entire aged population either separately from or in combination with the income of other members of the families with whom they live.

The tables in this publication focus on the income of the aged population separately, whether or not they live with other relatives. In contrast, in Bureau of the Census publications using CPS data, aged persons living with a younger relative who is considered the householder are classified as "families under 65." Thus, a portion of the aged population cannot be accounted for within the Census Bureau's categorization. But for the 24 percent of units aged 65 or older who lived with other family members in 1992, the income of the families with whom the aged units lived is

important information. Therefore, data on family income of aged units are presented in tables II.1 and 2, and VIII.1-6.

Several changes and additions have been made to this report to expand and improve the data series. To keep up with increases in income, the top limits of income distributions have been raised to \$200,000 or more for family and unit total money income and earnings; to \$50,000 or more for private pensions, government employee pensions, employer pensions, and income from assets; and to \$25,000 or more for Social Security. Tables have been added with distributions of private pensions, government employee pensions, and income from assets by quintiles of total money income. Detail has been added showing receipt of sources of income and distributions of earnings, private pensions, government employee pensions, and employer pensions for all persons, in addition to information already shown for men and women. And tables have been added on poverty and near poverty by detailed marital status of nonmarried persons based on both family income and person income.

Technical Appendix	135		
List of Tables			
I. Income Sources Received			
Aged Units			
1. Income sources by age, sex, and marital status: Percent of aged units 55 or older with money income from specified sources, 1992	1		
2. Income sources by age, sex, marital status, and Social Security beneficiary status: Percent of aged units 55 or older with money income from specified sources, 1992	6		
3. Income sources by age, sex, marital status, race, and Hispanic origin: Percent of aged units 55 or older with money income from specified sources, 1992	8		
4. Income sources by age, race, Hispanic origin, and Social Security beneficiary status: Percent of aged units 55 or older with money income from specified sources, 1992	11		
5. Income sources by quintiles of total money income and marital status: Percent of aged units 65 or older with money income from specified sources, 1992	13		
6. Receipt of retirement benefits, earnings, and income from assets by age, sex, and marital status: Percentage distribution of aged units 55 or older, 1992	15		
Persons			
7. Income sources of nonmarried persons: Percent of persons aged 65 or older with money income from specified sources, 1992	20		
8. Income sources by age, sex, and marital status: Percent of persons aged 55 or older with money income from specified sources, 1992	21		
9. Income sources by age, sex, race, and Hispanic origin: Percent of persons aged 55 or older with money income from specified sources, 1992	23		
		II. Family Total Money Income	
		1. Family total money income by age, sex, and marital status: Percentage distribution of aged units 55 or older, 1992	25
		2. Family total money income by age, sex, and marital status: Percentage distribution of Social Security beneficiary units 55 or older, 1992	30
		III. Aged Units or Persons, Total Money Income	
		Aged Units	
		1. Total money income of aged units by age, sex, and marital status: Percentage distribution of aged units 55 or older, 1992	35
		2. Total money income by age, sex, marital status, and Social Security beneficiary status: Percentage distribution of aged units 55 or older, 1992	40
		3. Total money income by age, sex, marital status, race, and Hispanic origin: Percentage distribution of aged units 55 or older, 1992	42
		4. Total money income by age, race, Hispanic origin, and Social Security beneficiary status: Percentage distribution of aged units 55 or older, 1992	45
		5. Total money income by quintiles of Social Security benefits and marital status: Percentage distribution of aged units 65 or older, 1992	47
		6. Total money income by marital status and receipt of various sources: Number of aged units 65 or older, and median total money income, 1992	48
		Persons	
		7. Total money income of nonmarried persons: Percentage distribution of persons aged 65 or older, 1992	50

List of Tables—Continued

¹ Income from reasonably permanent sources including retirement benefits, veterans' benefits, and income from assets.

² The money income and retirement income of aged married and nonmarried persons are compared with the official poverty income lines for couples or

nonmarried persons living alone, whether or not, in fact, they do so. In 1992, the poverty line was \$8,487 for a two-person unit aged 65 or older, \$6,729 for one person aged 65 or older, and \$9,443 and \$7,299 for two- and one-person units, respectively, under 65.

Table V.A.1.—Income from Social Security benefits by age: Percentage distribution of aged units 55 or older, 1992

Unit Social Security (recipients only) ¹	Age 55-61	Age 62-64	Aged 65 or older

¹ Quintile limits are \$6,939, \$11,226, \$17,645, and \$29,052 for all units; \$13,457, \$20,131, \$27,997, and \$40,973 for married couples; and \$5,707, \$8,007, \$11,558, and \$18,105 for nonmarried persons. The quintile limits for all units were mistakenly used for couples and nonmarried persons in the 1990 publication.

² Units with zero or negative total income are excluded. In addition, units with negative earnings are excluded from the earnings section and units with negative income from assets are excluded from the income from assets section.

³ Retirement benefits include Social Security benefits, Railroad Retirement, government employee pensions, and private pensions or annuities.

⁴ Social Security beneficiaries may be receiving retired-worker benefits, dependents' or survivors' benefits, transitionally insured, or special age-72 benefits.

⁵ Government employee pensions include Federal, State, local, and military pensions.

⁶ Fewer than 75,000 weighted cases.

¹ The money income of aged married couples and nonmarried persons is compared with the official poverty line for aged couples or nonmarried persons living alone, whether or not, in fact, they do so. In 1992, the poverty line was \$8,487 for a two-person unit aged 65 or older, \$6,729 for one person aged 65 or older, and \$9,443 and \$7,299 for two- and one-person units, respectively, under 65.

² Social Security beneficiaries may be receiving retired-worker benefits, dependents' or survivors' benefits, disability benefits, transitionally insured, or special age-72 benefits.

³ Fewer than 75,000 weighted cases.

⁴ Persons of Hispanic origin may be of any race.

¹ The money income of aged married couples and nonmarried persons is compared with the official poverty line for aged couples or nonmarried persons living alone, whether or not, in fact, they do so. In 1992, the poverty line was \$8,487 for a two-person unit aged 65 or older, \$6,729 for one person aged 65 or older, and \$9,443 and \$7,299 for two- and one-person units, respectively, under 65.

² Fewer than 75,000 weighted cases.

³ Social Security beneficiaries may be receiving retired-worker benefits, dependents' or survivors' benefits, disability benefits, transitionally insured, or special age-72 benefits.

⁴ Persons of Hispanic origin may be of any race.

This set of tables is part of a biennial series of studies on the income of the aged that began with data from 1976.¹ The technical appendix describes the data source of this series, defines some key variables found in the tables, and discusses the reliability of the estimates.

Source of Data

Data for this series are provided by the March Current Population Survey (CPS) of the Bureau of the Census.² The CPS samples a large cross section of households in the United States each year (approximately 60,000 in March 1993). The March supplement gathers detailed information on income and labor-force participation of each person 15 years of age or older in the sample households. For this series, a subsample of persons 55 or older is created, arranged in aged units with a separate data record for each married couple living together—at least one of whom is 55 or older—and for each nonmarried person 55 or older. Married persons living apart are classified as nonmarried persons.

From time to time, changes have been made in the survey. Although the changes have improved the measurement of income and labor-force participation, they have reduced the comparability of estimates made in different years.³

¹Income of the Population 55 and Older, Social Security Administration, biennial report beginning with 1976 data.

²For a detailed description of the basic CPS sample design, see the Bureau of the Census, *The Current Population Survey: Design and Methodology*, Technical Paper No. 40, 1978.

³These changes are discussed in some detail in the Bureau of the Census, *Current Population Reports*, Series P-60, various years.

Changes to the March 1989 CPS

A new processing system was instituted with the March 1989 CPS. The new system provides much more detail on sources of income received and on amounts from particular sources. This detailed information has been collected since 1980 but not placed on the public-use tape until 1989. In addition, changes have been made in the imputation system, the weighting system, the data acceptance program, the family relationship edits, and procedures to match income supplement records to the monthly CPS file. Comparisons of income measures from the revised and unrevised systems indicate relatively minor differences in various summary measures such as median income and poverty rates. Nevertheless, caution should be used when comparing these estimates with earlier ones.

The tape now identifies 46 separate types of income other than earnings, compared with 8 groups of items before 1989. Under the previous system one could identify the separate receipt of many sources of income, but the amount received from a particular source was sometimes combined with that received from another source. For example, amounts received from Social Security and Railroad Retirement were combined for persons receiving both, and amounts of government employee pensions and private pensions or annuities were similarly combined for recipients of both sources. In 1986, 1 percent of Social Security beneficiaries received Railroad Retirement, 8 percent of private pension recipients also had a government employee pension, and 16 percent of government pension recipients also had a private pension. For previous reports in this series, aged units

with both sources of income were excluded from estimates of amounts from one source. Under the new system, all income amounts are reported separately, eliminating the need to exclude cases.

The imputation process has been changed in three ways relating to this series. First, a greater number of imputations are made. In the past, if amounts from all sources in a group were missing, the group amount was imputed. However, if amounts from some sources in a group were reported and others were not reported, the grouped amount was not imputed. Under the new system, missing amounts of all individual sources are imputed. Secondly, the reported reason for receipt of benefits from income transfer programs other than Social Security (retirement, disability, or survivorship) is now obtained. Thus, knowing that a person receives a survivor benefit rather than a retired-worker benefit means that an imputed amount now reflects the type of benefit received. Finally, entire sets of income and noncash benefits are now imputed from the same person's record rather than from the records of separate persons, which preserves the interrelationships among amounts at the individual level. Each of these changes improves the estimates of income of the aged.

Definitions

Aged unit.—The major unit of analysis in Social Security surveys of the aged has been the aged unit rather than the construct of families and unrelated individuals used by the Bureau of the Census. With 55 as the age cutoff, aged units are married couples living together—at least one of whom is 55 or older—and nonmarried persons 55 or older. Persons who are married but not living with a

spouse are included in the nonmarried persons category.

Certain differences exist between Bureau of the Census and SSA figures because the units of analysis are not directly comparable. Aged persons living with a younger relative who is considered the householder are classified by the Bureau of the Census as members of nonaged families.⁴ Also, nonmarried individuals are treated simply as nonmarried persons by SSA. In comparison, the Bureau of the Census counts nonmarried persons living with other relatives as part of a family and nonmarried persons who are living alone or with nonrelatives as unrelated individuals. The Census Bureau's family category includes both married couples and those nonmarried persons who are living with relatives.

Census data show that the number of households with the householder aged 65 or older was 20,896,000 in 1992.⁵ In comparison, SSA data show that there were 23,579,000 units aged 65 or older in 1992. The SSA count generally includes the Census Bureau's aged households plus some aged units living in nonaged households or living with other aged units in the same household. The number of aged households was 89 percent of the number of aged units.

Age.—These tabulations cover units aged 55 or older (see definition of aged unit above). The age of a married couple is defined as the age of the husband—unless he is under 55 and the wife is 55 or older, in which case it is the age of the wife.

⁴The Bureau of the Census classifies families by characteristics of the householder—the first person in whose name a home is listed as owned or rented.

⁵"Money Income of Households, Families and Persons in the United States: 1992," *Current Population Reports*, No. 184, September 1993, table 1.

Total money income.—Total money income is calculated as the sum of all income received by the aged unit—before any deductions such as taxes, union dues, or Medicare premiums—from the following sources: Wages and salaries, self-employment income (including losses), Social Security, Supplemental Security Income, public assistance, interest, dividends, rent, royalties, estates or trusts, veterans' payments, unemployment and workers' compensations, private and government retirement and disability pensions, alimony, child support, and any other source of money income that was regularly received. Capital gains (or losses) and lump-sum or one-time payments such as life insurance settlements are excluded.

Total money income does not reflect nonmoney transfers such as food stamps, health benefits, subsidized housing, payments in kind, or fringe benefits from one's employment.

To reduce the amount of nonsampling error resulting from nonresponses, the Bureau of the Census has devised procedures to impute work and income data for all persons from whom this information is missing. Amounts assigned to a nonrespondent are those observed for another person with similar demographic and economic characteristics who did respond.⁶

⁶For a detailed discussion of these imputation procedures, see "Computer Method to Process Missing Income and Work Experience Information in the Current Population Survey," by Emmett F. Spiers and Joseph J. Knott in *Proceedings of the Social Statistics Section, 1969*, American Statistical Association. A more recent adjustment to the CPS imputation technique is described by Charles Nelson in "Adjusted Imputed Interest Amounts Based on Results of the CPS-IRS Exact Match" (Memorandum for John Coder, Chief, Income Statistics Branch, Population Division, Bureau of the Census, October 2, 1985). A brief description of revisions to the processing system as of March 1989 can be found in the Bureau of the Census, *Current Population Reports*, Series P-60, No. 166, 1989. For an overview of imputation techniques and an extensive reference list, see "Imputing for Missing Survey Responses," by Graham Kalton and Daniel Kasprzyk in *Proceedings of the Section on Survey Research Methods, 1982*, American Statistical Association.

Aged unit income.—Aged unit income is either the income of a nonmarried person or the sum of income from both spouses in a married couple. A married couple receives a source if one or both persons are recipients of that source.

Family income.—Family income is calculated as the sum of total money income of all persons related by blood, marriage, or adoption and residing together. Total money income is the same as family income for aged units who live with no other relatives.

Measurement of poverty.—The poverty concept, originally developed in 1964 by Mollie Orshansky of the Social Security Administration and revised by Federal interagency committees in 1969 and 1981, consists of a set of thresholds that vary by family size and composition. There are 48 thresholds for families composed of one to nine or more persons cross-classified by the presence and number of family members under age 18 (from no children to eight or more). One- and two-person families are further differentiated by the age of the family householder (under age 65 and aged 65 or older).

The poverty index for families of three or more persons is based on the cost of the Department of Agriculture's economy food

plan, multiplied by the ratio of income to food costs derived from the 1955 Household Food Consumption Survey. The factors used to derive the poverty index from food costs for one- and two-person families were higher. These criteria for determining the extent of poverty in the United States have become the basis for the official statistics issued annually by the Bureau of the Census in "Characteristics of the Population Below the Poverty Level," **Current Population Reports**, Series P-60. The poverty levels are adjusted to reflect changes in the annual average Consumer Price Index.

The poverty index was originally developed at a time when public noncash benefits for both nonneedy and needy families were relatively small and unimportant. It was, therefore, developed as a measure of income inadequacy of money income only. Nonmoney income is, therefore, not currently considered in calculating the poverty thresholds.

The official poverty measures used by the Bureau of the Census compare family total money income with the appropriate thresholds. Families as well as all persons in families with income below the appropriate threshold are considered poor. Tables VIII.1-6 of this report present measures of the poverty status of aged units based on their family income, similar to the official measures. They may, however, differ from Census estimates because of differences in the way in which families are classified as "aged" or not.

This report also presents selected "unofficial" measures of poverty by comparing total money income of aged units with thresholds for one- or two-person units under age 65 and 65 or older, even though some aged units live with other relatives (tables IV.4 and VIII.6-10), comparing aged unit amounts of

retirement income with one- and two-person unit thresholds (table IV.4) and comparing family total money income other than Social Security benefits with the family poverty thresholds (table VIII.5).

Interest also centers on the number who have incomes only slightly above the poverty line. This group, sometimes called the near poor, have incomes between the poverty line and 125 percent of the poverty line. Estimates of proportions who are poor or near poor are presented in tables VIII.1-4 and VIII.7-10 of this report.

Reporting of income.—Income amounts reported by persons in the CPS are somewhat less than amounts derived from independent sources such as the Bureau of Economic Analysis, Social Security Administration, and the Department of Veterans' Affairs. A comparison of aggregates from the March 1990 CPS (reported and allocated) with independent estimates found that the CPS accounted for 97 percent of wages and salaries, 97 percent of Social Security and Railroad Retirement benefits, 103 percent of private pensions and annuities, 83 percent of Federal government and military retirement, 77 percent of State and local government retirement, 89 percent of Supplemental Security Income payments, 51 percent of interest, and 33 percent of dividends.⁷ A matching of 1972 data from the Bureau of the Census, SSA, and Internal Revenue Service sources has provided a rich source for methodological comparisons of record and

survey information of individuals.⁸ In a report from the 1972 match, the adjusted mean income of families headed by a person aged 65 or older was 41 percent higher than that found in the CPS.⁹

Social Security beneficiary status.—

Beneficiary status is measured by the yes/no answer to the question in the CPS on receipt of Social Security benefits. Missing answers are imputed by the Bureau of the Census as referenced above.

Although Social Security benefits are referred to as retirement benefits in these tabulations, Social Security beneficiaries include not only retired workers, but also dependent spouses, dependents or survivors with young children in their care, and the disabled. According to SSA records at the end of 1992, 97 percent of persons aged 55-59 with a Social Security benefit were disabled; the remaining 3 percent were parents with young children in their care. At age 60, old-age benefits are available to survivors. Men aged 60-61 receiving a benefit are all disabled except for a very small number of widowers. Thirty-nine percent of women aged 60-61 receiving a benefit were disabled; the remainder were aged widows and those with young children in their care. At age 62, reduced retired-worker and dependent's benefits are available. Among persons 62-64, the proportions of beneficiaries with disability benefits were 21 percent of men and 9 percent

⁸See Social Security Administration, **Studies From Interagency Data Linkages**, a series of seven reports, including an introductory paper, published between August 1973 and June 1975.

⁹Daniel B. Radner, "Distribution of Family Income: Improved Estimates," **Social Security Bulletin**, July 1982, pp. 13-21.

⁷**Current Population Reports**, No. 184, Sept. 1993, table C-1.

of women. Almost all remaining men in this age group were receiving retired-worker benefits. Only a small number received father's or widower's benefits. The remaining women 62-64 were receiving benefits as retired-workers, dependents, or survivors.¹⁰

Reliability of the Estimates

Because the figures in this report are based on a sample of the older population, all reported statistics—counts, percentages, and medians—are only estimates of population parameters and may deviate somewhat from their true values—that is, from the values that would have been obtained from a complete census using the same questionnaires, instructions, and interviewers.¹¹

The standard error is primarily a measure of sampling variability—that is, of the variations that occur by chance because a sample rather than the entire population is surveyed. As calculated for this report, the standard error also partly measures the effect of response and enumeration errors but does not measure systematic biases in the data. The chances are about 68 out of 100 that an estimate for the sample would differ from a complete census figure by less than the standard error. The chances are about 95 out of 100 that the difference would be less than twice the standard error.

The figures presented in table A are approximations to the standard errors of estimated percentages of persons providing an indication of the order of magnitude of the

standard errors rather than the precise standard error for any specific item.

Standard error of estimated percentages.—The reliability of an estimated percentage, computed by using sample data for both numerator and denominator, depends on both the size of the percentage and the size of the total on which the percentage is based. Table A shows the standard errors of estimated percentages of persons. Use of this table in calculating the standard error of a single percentage is illustrated as follows:

An estimated 19 percent of units aged 65 or older had total money incomes of \$30,000 or more in 1992 (table III.1). Because the base of this percentage is approximately 23,579,000—the number of units aged 65 or older—interpolation using table A shows that the standard error of the estimated 46 percent is approximately 0.35 percent. The chances are 68 out of 100 that the estimate would have shown a figure differing from a complete census by less than 0.35 percent. The chances are 95 out of 100 that the estimate would have shown a figure differing from a complete census by less than 0.70 percent; that is, this 95-percent confidence interval would range from 18.3 percent to 19.7 percent.

For a difference between two sample estimates, the standard error is approximately equal to the square root of the sum of the squares of the standard errors of each estimate considered separately. This formula will represent the actual standard error quite accurately for the difference between separate and uncorrelated characteristics. If, however, there is a high positive correlation between the

two characteristics, the formula will overestimate the true standard error.

A comparison of the difference in the percentage of units aged 62-64 and 65 or older who had total money incomes of \$30,000 or more in 1992 illustrates how to calculate the standard error of a difference between two percentages:

Nineteen percent of the 23,579,000 units aged 65 or older and 36 percent of the 4,197,000 units aged 62-64 had total money incomes of \$30,000 or more in 1992—a difference of 17 percentage points. The standard errors of these percentages are 0.35 and 1.1 respectively. The standard error of the estimated difference of 17 percentage points is about

$$1.2 = \sqrt{(0.35)^2 \pm (1.1)^2}$$

The chances are 68 out of 100 that the difference is between 15.8 and 18.2 percentage points and 95 out of 100 of being between 14.6 and 19.4 percentage points. Because the confidence interval around the difference does not include zero, there is a statistically significant difference between the proportions who are 62-64 and those who are 65 or older with income of \$30,000 or more.

Confidence limits of medians.—The sampling variability of an estimated median depends on the distribution as well as on the size of the base. Confidence limits of a median based on sample data may be estimated as follows: (1) From table A using the appropriate base, the standard error of a 50-percent characteristic is determined; (2) the standard error determined in step 1 is added to and subtracted from 50 percent; and (3) the confidence interval around the median

¹¹Most of the discussion of estimation procedures has been excerpted from *Current Population Reports*, No. 114, July 1978.

corresponding to the two points estimated in step 2 is then read from the distribution of the characteristic. A two-standard-error confidence limit may be determined by finding the values corresponding to 50 percent plus and minus twice the standard error shown in table A. This procedure may be illustrated as follows:

The median total money income of the estimated 23,579,000 units aged 65 or older was \$13,959 in 1992 (table III.1). From table A, the standard error of 50 percent of these units expressed as a percentage is about 0.51 percent. As interest usually centers on the confidence interval for the median at the two-standard-error level, it is necessary to add and subtract twice the standard error obtained in Step 1 from 50 percent. This procedure yields limits of approximately 49 and 51 percent. By interpolation, 49 percent of units 65 or older had total incomes below \$13,686 and 51 percent had total money incomes below \$14,321.

Thus, the chances are about 95 out of 100 that the census would have shown the median to be greater than \$13,686 but less than \$14,321.

Table A.— Standard errors of estimated percentages of persons, 1992

Base of percentage (in thousands)	Estimated percentage				
	2 or 98	5 or 95	10 or 90	25 or 75	50
Total or white					
75	2.4	3.8	5.2	7.5	8.7
100	2.1	3.3	4.5	6.5	7.5
